

# Introducing our new and improved E & A Series Beams.

**FE8000 and FE8066 series beams now include these new standard features:**

- Redesigned beam head with “KwikLatch” release and ergonomic finger tabs
- Convenient new beam storage solution using an E-Track fitting and Keyhole slot

The new beam head design features a “KwikLatch” release mechanism that makes it easier to engage the beam head with logistic track from any position.

Traditional beam designs use a “tab” style release mechanism mounted on the top side of the beam head. This topside position leaves the release prone to damage compared to a topside release location.

This innovative new beam head design is now included as standard on all new beams in these series and can be retrofit into any existing beams from these series already in service.

Beams in these series now also include a single keyhole shaped slot punched in one end of the beam on one side of the beam extrusion. The slot facilitates a convenient storage solution for beams when not in use. The new accessory, the E-Key Fitting (Item# 80023), allows the operator to store the new beams with keyhole slot on a piece of logistic track mounted high on the trailer wall.

These improvements are just some of the many cargo control innovations brought to you by Kinedyne, The Cargo Control People for more than four decades.

Beam now features ergonomic finger tabs on both sides of the beam head

Optional accessory the E-Key Fitting (Item# 80023) provides method to store beams on logistic track
